Is she wearing braces?

suresmile
suresmile.com
Only she and her orthodontist know for sure.

That’s because her doctor prescribed suresmile Lingual braces. They fit behind her teeth and no one will know that she’s wearing braces. They’re virtually “invisible” to all. Even better, suresmile digital technology for orthodontics was developed to create beautiful, new smiles with precision never before possible.

How does suresmile lingual work?

A 3-D model of your teeth allows us to analyze your bite from every possible angle. Using this 3-D model and suresmile’s analytical tools, we determine your individualized lingual treatment prescription. Each and every movement of each and every tooth is planned to create the beautiful, healthy smile of your dreams.

Instead of bending orthodontic archwires by hand, your archwires will be custom-shaped using state-of-the-art robotic technology. This means that your teeth move directly to the prescribed position after the archwire is inserted. You’ll see great results in a shorter treatment time and no one else will see a thing!

The smile of your dreams… invisibly.

suresmile digital technology helps us to achieve faster, more precise results.

Digital scanning
An initial 3D model of your teeth using digital scanning technology.

Treatment planning
Using 3D virtual simulations, your individualized treatment plan is determined.

Treatment designed just for you!
To achieve your treatment goals, customized wires are formed just for you. Based upon your digital plan, suresmile technology provides a series of customized archwires that will gently move your teeth into their planned position, precisely. Since brackets are placed on the lingual side of your teeth, both bracket wires are not visible throughout the treatment.
